

# Lists

Working with a part of a list

## Working with a part of a list

What you should remember is:

- `List_name[x:y]` will start at the element indexed by `x` and it will stop at the element indexed by `y-1`, so **it won't reach y**, just like in `range(a, b)` (Because we said also that it will start at `a` and **it won't reach b**)
