

Files

Reading and writing

Reading and writing

What you should remember is:

- To **read** from a file: `file.read(x)` (`x` is the number of **bytes** that you want to read, without `x` Python will read all the file).
- To **write** to a file: `file.write(data)`.
- To **get** our position in a file: `file.tell()`.
- To **set** our position in a file: `file.seek(x)` (`x` is the position that we want to move in).
