

Requests

...

The 'get' requests

The 'get' request

First we need to install requests library using the command:

```
pip install requests
```

What you should remember is:

- To make a simple 'get' request: `request_name = requests.get('url')`
- To check our request: `print(request_name.ok)`
- To get the text in the 'url': `request_name.text`
- To get a binary content: `request_name.content`

The 'get' request

- To a json content: `request_name.json()`
- To pass url parameters: `requests.get('url', params = dict_name)`
- To pass headers: `requests.get('url', headers = dict_name)`
