

Variables

strings 5

Read a string from the Keyboard

What you should know is:

- Use `input()` to let the user type something on the keyboard.
- Use a variable to save what the user typed.
- Python receives everything the user enters as a string.
- You can print a string and wait for a reply using `input()`

Ex: `input("Enter your name: ")`

- In Python 2 use `raw_input()`.
